- 1** Yes I think the model is helpful to a developer, some associations are not included in the model but the reason behind is clearly stated in the assumptions.
- 2** It's easy for a domain expert to understand the model since it uses terms from the actual domain like boat and berth [1, p145]. The model does also focus on the reality with associations like "is placed at".
- 3** Strong points in this model is the simplicity of the concept classes only having attributes that implies need to remember information [1, p158]. Another strong point is the use of domain specific terms like Berth. Also the use of a association like handles between BoatRegister and Boat is sufficient instead of multiple register and remove associations [1, p151].
- 4** The model could be improved by the addition of a Calendar connected to the CalendarEvents using the conceptual class category catalogs [1, p141].
- 5** I think the domain model has passed the criteria for grade 2 (passing grade), since it includes all the important conceptual classes as well as appropriate associations between them.
